What changed overnight?

We watched three pages with saved sample content. Nothing here calls the live web. First we saved a baseline. A second look found no change. Then we simulated a careers update so the desk could show a real “changed” row.

In this run, **1** page changed and **2** stayed the same. The desk writes a short report you can open, share, or feed to a weekday morning check.

What changed overnight?

We watched three public pages with saved sample content. Nothing here calls the live web. First we saved a baseline. Then we ran again with a simulated careers change.

1	2	3
changed	unchanged	watched

Who we watch

Name	Address	After baseline	Note
n8n Careers	n8n.io/careers	Unchanged	No material change.
Linear Changelog	linear.app/changelog	Unchanged	No material change.
Personio Careers	www.personio.com/about-personio/careers/	Unchanged	No material change.

After the simulated change

Name	Address	Decision	What we saw
n8n Careers	n8n.io/careers	Changed	added: GTM Engineer
Linear Changelog	linear.app/changelog	Unchanged	No material change.
Personio Careers	www.personio.com/about-personio/careers/	Unchanged	No material change.

What this is worth

- You stop opening the same careers and changelog tabs every Monday hoping to notice a difference.
- A change is named in plain language — for example a new role heading — not a wall of HTML.
- Quiet pages stay quiet. Only the ones that moved need your attention.
- The same report can later wake Slack, a sheet, or a spoken brief. The judgment stays here.

Run the lab again with `python experiments.py`. For live pages later, put real links in `targets.yml` and use `python watch.py --live`.
